MEASURING YOUR WINDOWS

TintingDirect.com.au pre-cuts the film prior to shipment to make installation easier. We add 20mm to the actual height and width measurements that you provide to enable the installer to custom fit the film to the glass.

This means your measurements must be accurate to 5mm.

TintingDirect.com.au is not responsible for any errors that may result from inaccurate measuring of windows.

We have provided a Worksheet for you to print out and write down the window measurements for each room.

How to Measure for Window Film?

Measure each window pane to be tinted and record on the Worksheet the height and width of each pane in millimetres. Then record the number of panes that size (You do not need to add 20mm for custom fitting – we do that).

- DO NOT ASSUME THE FIXED PANE AND THE SLIDING WINDOW PANE ARE THE SAME SIZE – the fixed pane is often a bit larger - MEASURE EACH PANE TO MAKE SURE.

When you have recorded all your window measurements on the Worksheet, you can then enter the measurements in our on-line calculator for your DIY Quote.

TintingDirect.com.au WORKSHEET

Room	Height (mm)	Width (mm)	Number
Example – Bedroom	1125	865	2

Room	Height (mm)	Width (mm)	Number
